DURGA SOFTWARE SOLUTIONS

SCIP MATERIAL

Inner day: -

- -> Sometimes we can declare a class inside another class such type of classes are called <u>Enner classes</u>.
- -> Inner classes concept introduced in 1.1 version to fix GUI Bugs as the part of Event Handling
- -> But becoz of powerful features and benefits of Irmer classes slowly programmers are started using in regular coding also.
- -> "Without existing one type of object if there is no chance of existing another type of object" then we should go for <u>Irmer classes</u>.
- EZO: University consists of several departments. Without existing University there is no chance of existing Department.

Hence Department is the part of University and we have to declare Department class inside University class.

class University Outer class

class Department Frmer class

d

=
3

END: Without existing Bank object there is no chance of existing

Account object.

Hence we have to declare Account days inside Bank class.

class Bank

class Account

Er 3: Map is a collection of key-value paids and each keyvalue pair is called an Entry.

Hence Map is considered as a collection of Entry Objects. without existing Map object there is chance of existing Map Object. Hence interface Entry is defined inside Map interface.

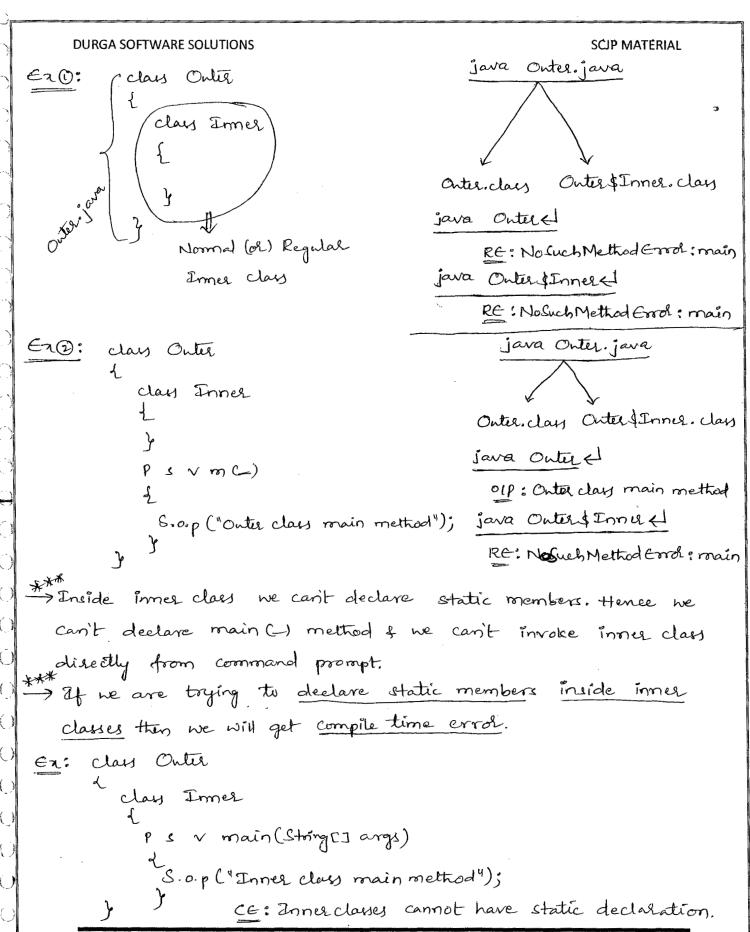

interface Map Outer interface interface Entry 2 2 mes interface Shiva 103

Note 1: - Without existing Outer class object there is no chance of existing Inner class object.

- @ The relationship blu Outer class & Inner class is not parent to child relationship. Et is Has-A relationship (Composition) Aggregation).
- -> Based on purpose of position of declaration all Enner classes are divided into a types.
 - 1. Normal (or) Regular Inner classes
 - 2. Method Local Inner classes
 - 3. Anonymous Enner classes
 - 4. Static Nested classes

1. Normal (or) Regular Inner classes:

inside a daw -> It we are declaring any named class directly in without static modifier such type of inner class is called Normal (or) Regular Inner class.

```

A.B.C c=honew CU;

New Ac). new Bc). new CC). m1();

Off: Enner most class method

- 2. Method Local Inner Classes:
- -> Sometimes we can declare a class inside a method such type of Inner classes are called Method Local Inner classes.
- -> The main purpose of Method local inner classes is to define method specific repeatedly required for ality.
- -> Method local inner classes one best suitable to handle nested method requirements.
- -> We can access Method local inner classes only inside the method in which we declared it i.e., from ontside the method we can't access.
- -> Hence Method local inner classes are most rarely used type of Enner classes (beeox their scope is very less).

Ex: class Outer

{
 public void m1()

{
 class Inner

 public void sum(int a, int y)

 |
 | S.o.p(a+y);

 |
 | Inner i=new Inner();

 i. sum(10,20); => olp:300

 i. sum(100,200); => olp:300

 i. sum(1000,2000); => olp:3000

 p

 rest t=new Test();

 t.m±();

DURGA SOFTWARE SOLUTIONS

SCJP MATERIAL

- Q: Et ne declare <u>m1()</u> method as static then at line() which variables we can access?
 - 1) i ×
 - 2) j V
 - 3) k x
 - 4) 1
- Q: Ef we declare m2() method as static then at line() which variables we can access?
- Ans: We will get co becox Ermer classes can't have static declarations.

 The only applicable modifiers for Method local inner classes are

 final, abstract & strict-fp.
- 3. Anonymous Inner Classes:
- -> Sometimes we can declare inner class without name such type of inner classes are called Anonymous Enner classes.
- The main purpose of Anonymous Inner classes is just for instant use (1 time usage).
- -> There are 3 types of Anonymous Enner classes.
 - 1. Anonymous Inner class that extends a class
 - 2. Anong mous Innex class that implements an interface
 - 3. Anonymous Inner class that defined inside alguments.
- 1. Anonymous 8nnie class that extends a class:
- E2: class PopCorn

 1

 public void taste()

 2

 S.o.p("Salty");

 y 100 mole methods

```
class Test
    PopColn p=new PopColn()
      public void taste()
       25-0-p ("spicy");
      P. tastel); = 010: Spicy
      PopCorn Pi=new PopCorn();
      Pr. tastec); = olp: Salty
      Pop Corn P2 = new Pop Corn()
      2
public void taste()
        | S.o.p ("Sweet");
       P2. taste();=> of : Sweet
```

Analysis:

1. PopColn p=new PopColn();

- -> we are creating just PopColn object.
 - 2. PopCorn p=new PopColn()

-> We are creating child class for PopCorn without name (Anonymous Ermer Class).

-> For that child class we are creating an object with parent reference.

```
DURGA SOFTWARE SOLUTIONS
```

SCIP MATERIAL

```
3. Popcoln p=new Popcoln()

{

public void tasti()

{

S.o.p("Spig");
}
```

-> We are creating child class for PopColn without name (Anorymous Inner class).

-> In child class, we are overliding taster, method for that child class we are creating an object with parent reference.

class Test

f s v m(-)

t

Thread t=new Thread()

for Cint i=0; i210; i++)

L S.o.p ("child Thread");

y;

t. start();

for Cint i=0; i210; i++)

L

Ils.o.p ("main Thread");

}

2. Anonymous Ermer class that implements an interface:

En: class Test

PSVM(-)

```
DURGA SOFTWARE SOLUTIONS
```

SCIP MATERIAL

```
Rumable l=new Runnable()

public void run()

for (int i=0; i<10; i++)

| S.o.p("child Thread");

y

Thread t=new Thread();

t. start();

for (int i=0; i<10; i++)

L S.o.p("main Thread");

y

}
```

3. Anonymous Enner class that define inside arguments:

Ex: class Test

PS v m(L)

new Thread (new Runnable ()

public void ounc)

Loc(int i=0; i210; i++)

Lo

for (int i=0; ic10; i++)

L. S. o. p ('main Thread");

(بر

Anonymous Inner class vs Normal class:

- -> A Normal Java class can extend only one class at a time, but Anonymous Innex class also can extend only one class out a time.
- -> A Normal Java class can implement any no. of interfaces at a time, but Anonymous Inner class can implement only one interface at a time.
- -> A Hermal Java class can entend a class and can implement any no. of interfaces simultaneously, but Anonymous Inner class can extend a class & implement an interface simultaneously.
- The main application area of Anonymous Inner classes is to implement QUI based applications for Event Handling.

Ex (impost java. awt. event. *;

impost java. awt. event. *;

public class TasDemo

{

Frame f=new framel);

f. add Window Listener (new Window Adapter ())

{

public void window Closing (Window Event e)

{

System. exit(o);

});

f. add (new Label ("I can create Executable Tax File!!!"));

f. set Size (500, 500);

f. set Visible (true);

EZD: class SomeGUI extends JFrame

JButton 61, 62, 63, 64, 65, 66;

61. add Action Listener (new Action Listener ()

public void setion Performed (Action Event e)

[2]

[1]

[1]

[2]

[3]

[4]

[5]

[6]

[7]

[7]

[7]

[8]

'b2. add Action Listener (new Action Listener ()

Epublic void actionPerformed (ActionEvente)

4. Static Wested classes:

- -> Sometimes we can declare inner class with static modifier such type of inner classes are called Static Nested classes.
- -> En Normal (ot) Regular Inner class, without existing Outer class object. There is no chance of existing Inner class object.
- -> But in case of Static Nested classes, without existing Outer class object there may be a chance of existing static Nested class object i.e., Nested class object is not strongly associated with Outer class object.

En: clan Test d static clan Nested

```
DURGA SOFTWARE SOLUTIONS
```

SCIP MATERIAL

```
public void m1()

L S.o.p ("Static Nested class method");

y

p s v m()

l

ll Test. Nested n=new Test. Nested(); (outside of the class)

Nested n=new Nested();

n.m1();

n.m1();
```

- -> In Nolmal of Regular Inner classes, we can't take static declarations, but in Static Nested classes we can take static declarations including main() method also.
- -> Hence we can invoke static Nested class disectly from command prompt.

class Test

Static class Nested

java Test \$ Nested &

Olp: Stalic Nested clay main method.

- From Normal (or) Regular Inner class, we can access both static & non-static members of Outer class directly.
- -> But from Static Nested class, we can access only static members

of Onter class directly.

Ex: class Test int 2=10; static int y=20; Static clay Nested public void m1() & S.o.p(a); -> CE: non-static variable x cannot be

019:20 t ** Hw Hormal Enner Class of Static Mested Class:

Hormal Inner class

1. Without existing Outer class object there is no chance of existing Inner class object i.e., Inner class object is strongly associated with Outer class object (Composition).

- static declarations are not allowed. 3. In Normal Inner class, we can't declare main (_) method of hence we can't invoke inner class directly from command prompt.
- 4. From Normal Innel class, we can access both static 4 non-static members of Outer class directly.

Static Wested Class

referenced from a static content.

1. Without existing Outer class object there may be a chance of existing Static Nested class Object i.e., Static Nested class object is not strongly associated with onter class object (Aggregation).

- 2. In Static Nested classes, we can 2. In Normal (or) Regular 2 mer classes, declare static members.
 - 3. In Static Nested classes, we can declare static members of hence we can invoke Static Nested class directly from and prompt.
 - 4. From Static Nested Classes, we can access only static members of Outer class directly.

DURGA SOFTWARE SOLUTIONS

SCJP MATERIAL

Various possible combinations of classes and interfaces:

1. class inside a class:

-> Wittout existing one type of object if there is no chance of existing another type of object then we can declare a class inside another class.

En: class Oniversity

Class Department

[L
]

- -> Without existing University object there is no chance of existing Department object.
- -> Honce we have to define Department class inside University class.
- 2. interface inside a class:
- -> Inside a class, if we require multiple implementations of an interface & these implementations are relavant to a particular class then we can define an interface inside a class.

Ez: class VeehicleType

Interface Vechicle

I public int getNoOfWheels ();

class Bus implements Vehicle

I public int getNeOfWheels ()

"return 6;

"class Auto implements Vechicle

I public int getNeOfWheels ()

L return 3;

- 3. interface inside interface:
- -> we can declare interface inside interface.

Ex: interface Map

public Object get Key ();

public Object getValue();

public Object setValue (Object o);

-> Hence we can implement Inner interface directly without implementing Outer interface.

-> Whenever we are implementing Outer interface we are not required to implement Inner interface i.e., Outer of Inner interfaces we can implement independently.

En: interface Outer

public void m1();

Interface Inner

public void m2();

class Tests implements. Outer. Inner

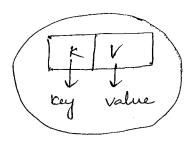

public void m2()

LS.o.p("Imer interface method");

Iclass Teste implements Outer

public void m1()

d S. o. p ("Outer interface method");

PLOT NO.56, HARSHA CHAMBERS, SAI NAGAR,NEAR BIG C MOBILES, MADHAPUR-500034, MOBILE:9505905786

- 4. dans încide înterface ?
- interface then it is highly recommended to declare that class inside interface.
- interface Email Service

 public void sendMail (EmailDetails e);

 class EmailDetails

 private String to list;

 private String subject;

 private String ce-list;
- -> En the above example, Email Details thality is required for Email Service of we are not using anywhere else.
- -> Hence it is highly recommended to declare EmailDetails class inside EmailService interface.
- -> We can also declare a class inside interface to provide defaultimplementation for that interface.
- Ex: interface Vechicle

 public int getNoOfWheels();

 class DefaultVechicle implements Vehicle

 public int getNoOfWheels()

 d return 2;

 3
 - class Bus implements Vehicle

 d public int getNbOfWheels()

 L return +;

→ In the above example, DefaultVechicle is the default implementation of Vechicle interface where as Bus is customized implementation of Vechicle interface.

Note: - Every class which is declared inside interface is always public static. whether we are declaring or not.

Hence we can create object directly without implementing interface 4 without creating an instance of interface type.

Conclusions:

-> we can declare anything inside anything.

interface X L interface Y L

-> Nested înterfaces are always static, but Nested class need not be static always.
